

LEOLIGHT
Products for Hospitality Professionals

MAKE THE SAFE SWITCH TO BIG WICK™

Reduce liability from shipping to storage to use.
Stop using dangerous flammable gels and substitute with equal heat.
Make the switch today to LeoLight's super safe Big Wick™ fuels!

Gel fuels, both ethanol and methanol, are highly flammable and categorized as dangerous goods (DG). DG Gel fuels cost extra to ship, require greater consideration to store, are more expensive to insure and must involve a more robust level of education for both the distributor and end user. Wick fuels, however, are not a dangerous good, and are categorized the same as vegetable oil. They do not require any of the special considerations as Gel fuels, and are therefore the safer option. LeoLight's Big Wick fuels use a wide flat-pad wick which maximizes heating power, providing the same high levels of BTU as gel fuels, while minimizing liability and eliminating the dangers associated with gel fuels. LeoLight's Big Wick is truly the safer chafer solution!
